

PCM2000

Maintenance and support software with copy protection key

Once logged on to a panel or network, the program offers the following modes of operation:

Emulation mode

Visualisation of the full front of the Fire panel, including LCD screen and common LEDs. Since all panel buttons can be accessed through the PC, it is possible to browse through every single menu screen to consult or modify.

Data retrieval mode

Retrieve any available data from the panel(s) to evaluate, prepare for servicing sensors, archive or create reports.

Central Station mode

In case of an alarm, fault or condition the panel(s) can dial in to the PC station that receives messages, displays them on the screen and save them on the PC's hard disk. This operation can be with or without acknowledgement of these information. Filters can be used to restrict the information flow.

History log mode

A tool to analyse the panel's events previously stored on the PC's hard disk under Central station mode.

Address book

Database of all sites that can be contacted to allow user friendly, error free and fast connection.

Settings

Allows modem, serial port and session settings as well as local languages selection.

Standard Features

- **Provide communication with single fire panels and networked fire systems, both locally or remote via modem**
- **Windows 95, 98 and NT compatible**
- **For use with FP2000, FP1200**
- **Full panel emulation**
- **Data retrieval**
- **Central station**
- **History log**
- **Address book**
- **Dynamic Link Library (DLL) for third party integration**

PCM2000

Maintenance and support software with copy protection key

Specifications

Processor	Pentium 133Mhz (or better)
RAM	32 Mb (or more)
Display Adapter	VGA
Hard Disk Space	20 MB
Pointing Device	Bus or P/S2 Mouse
Graphical Environment	Windows 98, NT or 2000
Communications ports	Depending on Drivers Printer port (for key) 1 Parallel
