

KTD-445
Video Loss Card

The red colour-coded video loss card monitors incoming video signals. When a video-related malfunction occurs, it audibly alerts users and generates an on-screen list of faults. On-screen menus enable users to specify which video inputs are scanned for video loss. Video loss detection levels are adjustable.

The KTD-445 uses one monitor output to provide video signal detection. Diagnostic LEDs indicate when the card is powered and processing, the data rate of slave communication, the data rate of control communication and when a fault has been detected.
